

Global 3000 Service Pack Note

Table of Batch Details - Default Batch Reference

Author	DCP		
Project	ZM60_000303.doc		
Version	1.0		1 of 2

INTRODUCTION

This service pack updates the Table of Batch Details window.

The changes update the Table of Batch Details window in Manufacturer and POP Goods Receipt to default the batch reference prompt to the next available batch number as per the other batch receipt windows in the system.

DOCUMENTATION CHANGES

Table of Batch Details

The screenshot shows the 'Table of Batch Details' window. The 'Receipt Details' section includes a 'Product' field with 'BATCH' and 'Batch Tracked', and three rows for 'Receipt quantity' (50), 'Qty assigned' (0), and 'Remainder' (50), each with an 'ITEM' button. Below this is a table with columns 'Reference', 'Description', 'Bin Number', and 'Quantity'. The first row has '6' in the 'Reference' column. The 'Batch Details' section has a 'Status' dropdown. At the bottom are buttons for 'Generate', 'Amend', 'Apply', 'OK', and 'Cancel'. The status bar at the bottom shows 'Partition 2 Computer 1D', a clock '11:51:51', and other system information.

Reference Enter up to 10 characters as a reference for the batch. This defaults to the next available batch number for the product.

Note Different batches can have the same batch reference. Alternatively, if you use the auto-generation feature to create a separate batch for individual units received, references on those batches can be automatically incremented.
